Areg Shahbazian

Senior Software Engineer - React / Electron - BSc AI

Remote - CET-GMT+4 overlap - Dutch national - areg.uvagm@gmail.com
areg.nl - areg.nl/workflow - github.com/AregShahbazian - linkedin.com/in/areg-shahbazian

Eight years as the primary frontend engineer of a multi-exchange crypto trading platform, from the first Electron/React release to today's desktop, web and mobile builds.
Built the trading workspace, the replay/backtest engine and the charting integrations.
Since 2026 the emphasis is on architecture, specification and review in a spec-first, review-gated LLM-assisted workflow, written up with a fully published worked example at areg.nl/workflow.
BSc Artificial Intelligence, University of Amsterdam.

EXPERIENCE

Senior Software Engineer (Frontend) - Altrady, freelance, remote — Sep 2018 - present

Altrady is trading software for active crypto traders: market scanning, charting, advanced order execution, bots, portfolio tracking, paper trading, backtesting and journaling in one workspace, across 19+ exchanges. Largest single contributor to the desktop and web app since its first release.

- **Trading-terminal workspace.** Dockable multi-widget layout with per-device (desktop, tablet, mobile) layouts and presets. Led the migration from react-grid-layout to flexlayout-react without breaking saved user layouts.
- **Replay / backtest engine.** Bar-by-bar replay with speed and step controls, replay trading where orders fill against replayed candles, saved backtests and step-back optimisation. First built on the TradingView Charting Library, whose sparse documentation and uneven API had to be tamed into a smooth feature, later ported to a custom charting library.
- **Charting integrations.** TradingView datafeed and on-chart orders, alerts, DCA and grid-bot previews, custom indicators and drawings. In 2026, integration of a custom charting library with multi-chart, replay and sandboxed user scripting, coexisting with the TradingView charts during rollout.
- **Design system.** Shared component library with Storybook and light/dark design tokens, used across the whole app.
- **Interactive tutorials and quizzes.** Chart-driven trading quizzes with an authoring editor, replay-based playback, grading and progress, later a guided smart-trading tutorial. Sole owner.
- **Accounts, portfolio and scanning.** Exchange API-key onboarding, 2FA and authorized devices. Portfolio and trading analytics, base scanner and market explorer, order, position and alert widgets, paper trading.
- **Delivery.** Four-language i18n, web build target, React Native webview shell for mobile, Electron 2->44 and React 16->19 upgrade sweeps, GitHub Actions CI.
- **2026: architecture and review.** Specifications, architecture and review of all frontend contributions, including LLM-assisted ones from non-engineers, using my own spec-first workflow (PRD -> design -> tasks -> implementation -> review).

Electron, React, Redux, styled-components, Tailwind, Jest, Storybook, Webpack, Sentry, websockets (Phoenix Channels). TypeScript in the charting library and exchange client. Linux/Ubuntu daily driver since 2014.

Frontend Engineer - Datumize, Barcelona, freelance, remote — Apr - Aug 2018

React/Redux management UI and a shared component library for a data-capture platform, plus code review for the team.

Software Engineer - ING Bank via Young Colfield, Amsterdam Jan 2017 - Jan 2018

Scrum team owning the Java/Spring REST APIs for assisted banking transactions: endpoints, business logic, JUnit/Mockito unit tests, Robot Framework and Gatling automation, deployments across environments.

Software Developer - Ritense, Amsterdam 2016

Full-stack work for a small agency: Java Spring Boot APIs (Hibernate, MySQL, Docker, Jenkins) and ColdFusion web applications for clients including Elsevier, up to nine applications in one sprint.

Freelance Developer - Kisport Martial Academy 2015 - 2016

First solo production system: member administration and exam-enrollment web app (PHP, MySQL, jQuery), from stakeholder interviews and data migration to hosting and support. In daily use for years.

EDUCATION

BSc Artificial Intelligence - University of Amsterdam 2011 - 2015

Thesis: Taking up the RoCKIn@Work object recognition challenge with the Bag of Keypoints approach - computer vision and machine learning in C++ (OpenCV, PCL, ROS).

Projects: autonomous exploration with an unmanned aerial system (Netherlands Aerospace Centre), and predicting bird behaviour from GPS and accelerometer data with machine learning.

Subjects: machine learning, computer vision, robotics, logic, speech recognition and synthesis, knowledge systems.
